Agenda

01 Lab Overview and Goals

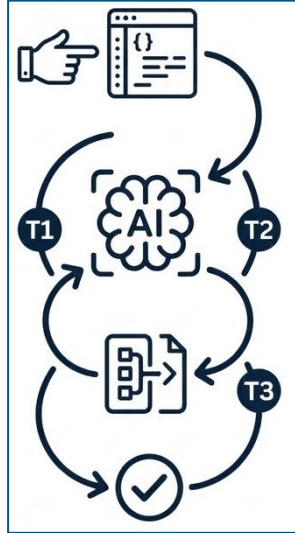

02 Setup Guidance

03 Let's Start Building!

AI = Agentic

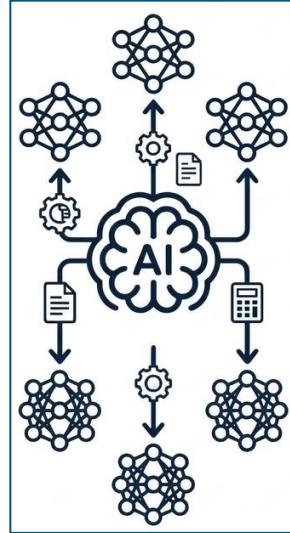

Agentic AI – In a Nutshell

Agentic AI

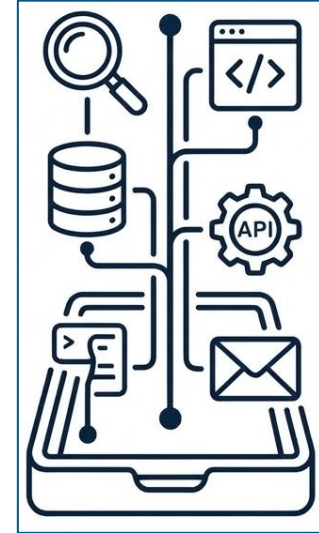

Models

Collection of selected for the appropriate tasks

Tools

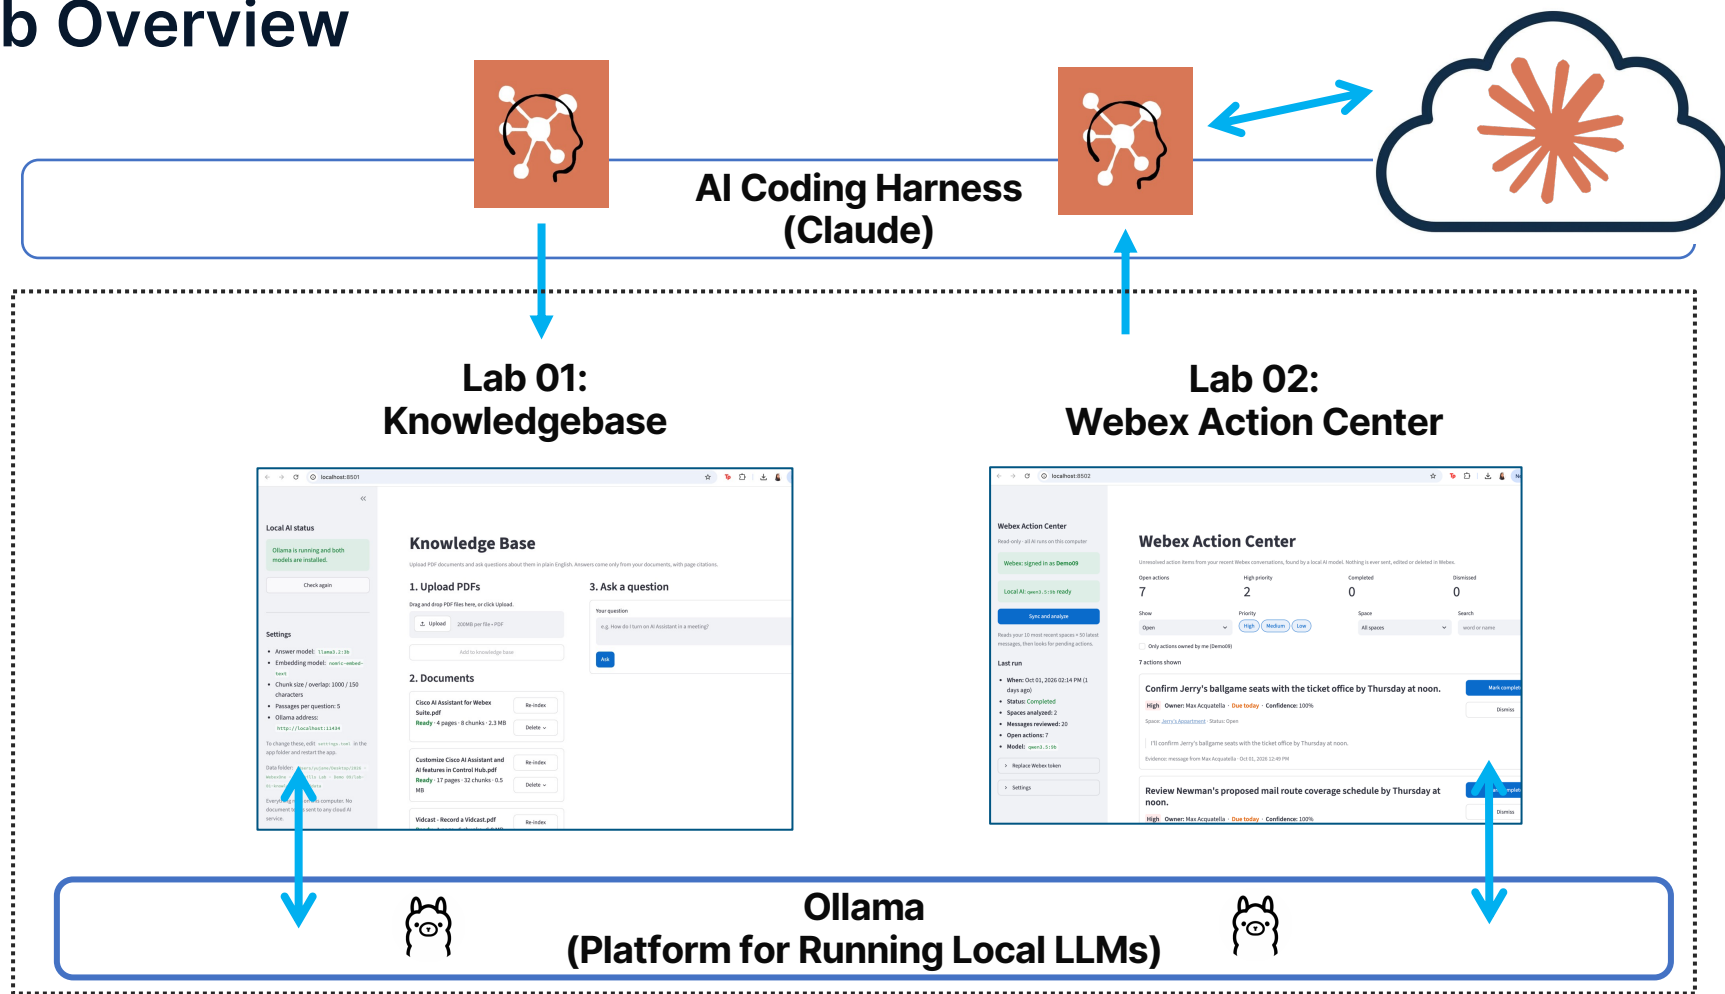

External tools for data and tasks

Turns

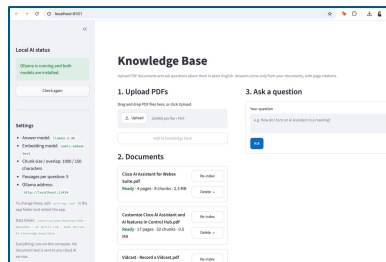

Multi-step sequential logic and feedback loops

Lab Overview

Lab Progression

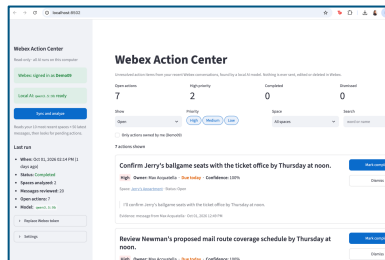

Lab 01: Knowledge Base

Building a basic knowledge base that queries documents

We're getting familiar with vibe coding

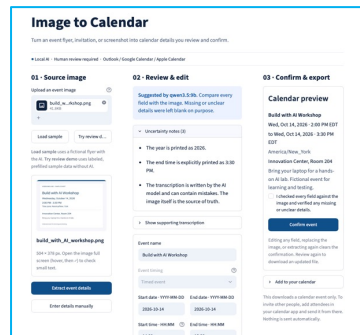

Lab 02: Webex Action Center

Building a portal that combs through messages and finds action items

We're starting to use components that plug into other systems

Lab 03: Image to Calendar

Building a portal that inputs media and converts it to a calendar entry

We're using more sophisticated features of LLMs

Build Your Custom Project

Use what you've learned ...
... and use the existing code, skills...
...and build something custom

“Context rich” session

Vibe Coding Is ... Weird!

Vibe Coding Is ... Weird!

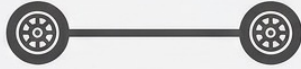

Your education up till now:

**learn → practice and get good
→ then do the complex thing**

Vibe coding:

**learn a little → start doing the complex thing
→ learn / ask questions / iterate → keep building**

**Your start building things *before*
you fully understand the underlying tools!**

How to build a minimum viable product

What Are “Skills”?

- Increasingly used as the term for collection of documents to guide LLMs for customization
- Important distinction: they persist across multiple sessions and building projects.

As you engage in a conversation with a coding harness, supporting files and documents get updated (usually by the coding agent itself)

Why “Private” LLMs (Ollama)?

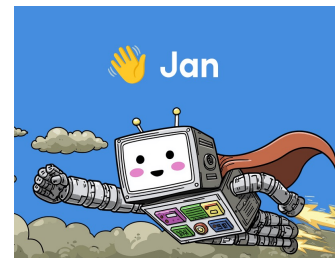

- **Privacy!**
- **Cost:** running locally is minimal / low cost
- **Tradeoff:** most local LLMs are not as sophisticated / general problem solvers as frontier models...
- ... however, you don't need the most sophisticated AI for some routine tasks!
- **Examples:**

Ollama

LM Studio

Jan.ai

Vibe Coding Is ... Weird

- **We have deliberately crafted prompts that may have elements you don't know ... and that's OK**
 - Ask questions if you're curious
 - Use the glossary for reference

??!

Starting Prompt

PROMPT

Copy

Build me a simple app called "Knowledge Base" where I can upload PDF documents (for example, product documentation such as Webex guides) and ask questions about them in plain English. Keep all document processing and AI inference running locally on my machine—no cloud AI services or external AI API calls.

Use Python 3.12+, uv for dependencies, and Streamlit for the interface. Give me a PDF upload area, a list of uploaded documents with their processing status, and a question-and-answer area.

Here's how it should work:

- Use PyMuPDF to extract text from each PDF, page by page. Clean up the text and split it into consistent, repeatable chunks while keeping track of filenames and page numbers.
- Use Ollama with nomic-embed-text to create embeddings and ChromaDB to store and search them. Keep document details and chunk mappings in SQLite.
- When I ask something, find the relevant chunks and pass them to Ollama's llama3.2:3b model to generate an answer.
- Instruct the model to answer only from the uploaded documents. Include citations with the filename and page number, and show the retrieved text so I can check the evidence. If the documents don't contain the answer, the model should say so.
- Answer one question at a time; conversation memory isn't needed for the first version.
- Save uploaded PDFs in data/uploads and keep the index between app restarts.
- Create the project in a subfolder named `lab-01-knowledge-base` inside my connected folder. Configure Streamlit to always run on port 8501 (in `.streamlit/config.toml`), so it won't conflict with my other lab apps and they can all run at the same time. Show the address `http://localhost:8501` in both guides described below.
- Sample PDFs are in the `Sample PDFs` folder inside my connected folder. Use them to test the app.

Handle repeat uploads sensibly. If the filename and contents are unchanged and the vectors are valid, skip it. If identical contents arrive under a different filename, skip that too. If the filename matches but the contents changed, replace the old version and its indexed content. If processing was incomplete or vectors are missing, repair things when the file is indexed again.

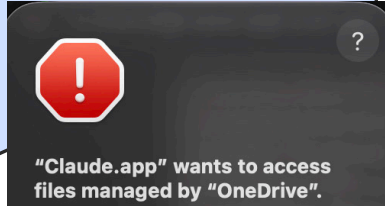

Prompts That Are OK to Ask...

I need help!

Build me a table of the components used in this lab (like Streamlit) and their function

Max and G were using big words... I got confused! Explain this in plain English...

I'm stuck and got this error...

I'm lovin' this!

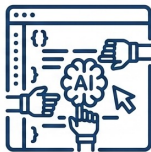

Give me the same output with the actual terminal commands one-by-one

AI is the ultimate “safe space” to ask any question!

Let's Get Started!

Lab 0: Organization and Setup

Step 0: You are all members of an organization: **paradigmventures.ai**

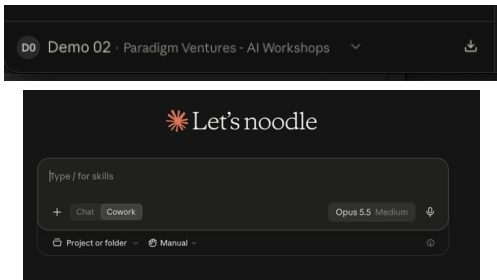

demo-01
demo-02
...
demo-30

Step 1: Login to Claude desktop app with your assigned login demo-xy@paradigmventures.ai

Step 2a: Login attempt sends the verification link to the Outlook account...

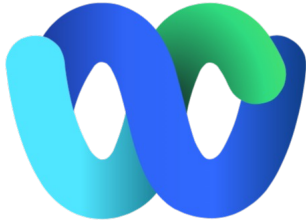

Step 2b: Forwarding to your personal / work email, which you access from the **same laptop as Claude desktop app**

Gmail

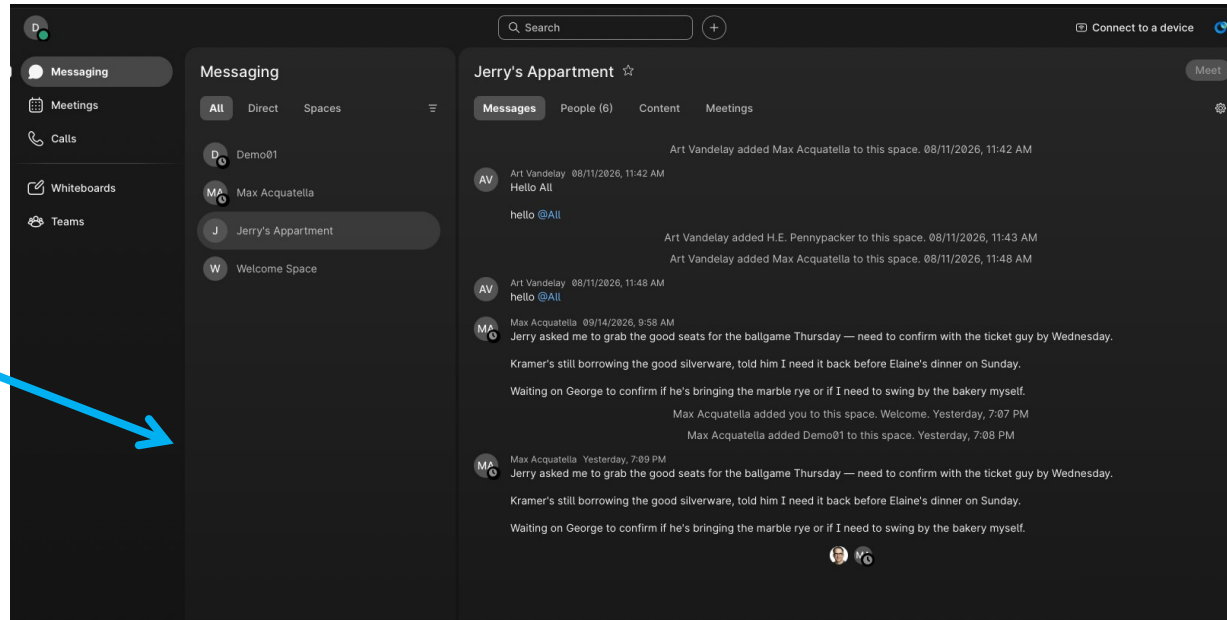

**Critical that the verification link is clicked from an email client
on the same laptop that hosts the Claude desktop app**

Webex Accounts

Login: demo-xy@paradigmventures.ai
Password: Cisco123#

Feel free to use Webex messaging directly in the browser...
you can send messages to other users in the lab!

Lab Guides

webexone ²⁶

WEBEXONE 2026 - BUILDING AI SKILLS

Your lab journey

4 steps, one Claude session. Start with Lab 00 and work through the labs in order; each lab lists what you'll need right next to it. **Open guide** opens the lab as a web page.

BEFORE YOU START

Participants — Session 1

Find your name to see your demo account (demo-xy) and sign-in details.

Open participant list PDF .mcl

LAB 00

Let's Get Started!

Set up the Claude desktop app, a Cowork session and Ollama on your laptop.

Open guide PDF .mcl

LAB 01

Build Your Personal Knowledge Base

Ask questions about your own documents and get answers with sources, using an AI model that runs privately on your laptop.

You'll need:

- Sample PDFs (5 files)
- Sample documents to upload to your Knowledge Base

- **Participants – Session 1:**
 - Has your userID: demo-xy... and other information

Go to Lab 00 and get started

<https://gcodekhanna1.github.io/2026-10-ai-skills-lab/>

Keep in Mind...

- **Take your time ... No rush!**
 - You are building Minimum Viable Products (MVPs) ... perhaps more...
 - If you don't finish, you have all the materials to continue working...
- **Claude can take some time to “think”, and ask you questions**
 - Especially during the opening prompt (initial build) ... can take 10+ minutes
 - Feel free to take a break during long prompt runs ... but stay close to Claude as it may ask for permissions.
- **Feel free to be creative!**
 - Treat the lab guides and prompts as templates / starting point.
 - Use Claude as a thought / creative partner.
- **What good habits / best practices can you see developing from this?**
 - Guidelines/best practices document for guiding AI → skills file
 - Your preferences for look/feel of the UI, etc. → skills file
- **We're all learning here ... and AI can make mistakes!**

*“You have taken your first
step into a larger world.”*

Share your experience!
